

## **ABSTRACT**

A transfer tape dispenser includes a case, a supply spool, a return spool, and a substantially rigid applicator tip having an application edge. The applicator tip is disposed in a path of a transfer tape that originates from the supply spool and terminates at the return spool. When pressing the application edge on a surface, an application layer of the transfer tape adheres to the surface. The transfer tape dispenser includes a cushion that cushions the pressing of the application edge on the surface. The transfer tape dispenser further includes a slip clutch mechanism for providing slipping of the supply spool relative to the rotation of the return spool, when necessary, to maintain a desired tension in the correction transfer tape.
